

About Number Guessing Game

👋 Hi there!

In this course, you are going to build a small but surprisingly addictive Number Guessing Game, line by line and decision by decision.

We'll guide you along the way, but the code (and the win) will be all yours.

By the time we're done, you'll have something you can:

- Show off on LinkedIn or GitHub
- Share with friends and family
- Keep improving as you learn more

Here's a sneak peek:

```
Welcome to number guessing game.  
  
I've picked a number for you to guess.  
The number is between 1 and 5.  
  
Guess a number: 1  
  
Your guess is not correct.  
Give it another shot.  
Choose a higher number.  
  
Enter guess number again: 2  
  
Correct guess.  
You won. Thank you for playing.
```

It might look simple, but don't underestimate it. This little project will teach you how to think like a programmer. You'll practice breaking problems into steps, writing real logic, and having fun while learning.

When you're ready, hit Next Lesson and we'll show you what's coming before you dive in.

What You Will Learn 🎲

In this project, you'll build your very own number guessing game step by step. You'll write real Python code, test it, and watch your game come to life on screen. 🖥️

Along the way, you'll learn how to:

- Build the game's core logic
- Improve the player's experience with clear, friendly messages
- How to let game choose a new secret number each time you play

Most importantly, you'll get into the habit of thinking like a developer. That means breaking a big goal into smaller steps and solving each one until the whole thing works.

When you're ready, click [Next Lesson](#) to make sure you have the basics down before we start.

What You Need

Before we dive in, make sure you're comfortable with a few Python basics:

- Printing text to the screen
- Creating and using variables
- Working with different data types
- Writing if-else statements
- Using while loops to repeat actions

If you have come from [Learn Python Basics](#), you're good to go.

First Step ✨

Every project needs a home, a place where your code can live. For us, that means creating a Python file.

Think of it like opening a brand new notebook before you start writing.

In this lesson, you will:

- Create a Python file for your game
- Run a quick test to make sure Python is awake and ready

Once that's done, you will be ready to start building the game for real.

When you are ready, click Next Lesson and we will make your very first file.

Create the Entry File

Look at the code area on the right. That's where you'll write and run your Python code.

Every program needs a place to start. In Python, that starting point is usually a file called `main.py`.

All you need to do now is make that file. That's it.

To create it, click the file icon with a plus sign in the Explorer, type `main.py` as the name, and press **Enter**.

Once you've created `main.py`, click **Check Task** to confirm it, then move on to the next lesson. 🚀

✓ Task 1

Create a file named `main.py`.

Check if Python is Working

Great job getting your file ready. That is your first real step toward building something fun. 🎉

Now let's make sure Python is awake and ready to help.

Most people test this by printing `Hello world`, but since you are building a game, let's do something a little more fun.

Print a welcome message for your players. Run your code, and if you see the message appear, Python is working perfectly.

When it works, click **Check Task** and keep going.

Task 2

In `main.py`, print the following welcome message:

```
Welcome to number guessing game.
```

You're Up and Running! 🎉

Well done. You have just completed two important steps:

- ✅ Created your project file (`main.py`).
- ✅ Printed your first message to the player.

They might look small, but these are big milestones. Every great project begins with clear, simple steps like these.

Next, you will start building the actual game. 🚀
